Register for https://exercism.org/ using your GitHub ID

Once logged in, sign-up for the Scala track.

Follow these instructions to setup the Exercism CLI locally.

Once you have the setup fully going, solve the following problems

Easy:

- **Two Fer:** (Easy) This is a good warm-up to check basic syntax and function creation.
- **Reverse String:** (Easy) String manipulation is a fundamental skill.
- **Sum of Multiples:** (Easy) This involves iteration and conditional logic, which are common in data filtering.
- **RNA Transcription:** (Easy) This exercise involves basic sequence transformation.
- **Accumulate:** (Easy) This exercise focuses on applying a function to each element of a collection.

Medium:

- **Matching Brackets:** (Medium) This problem requires keeping track of state and ensuring proper structure, which can relate to data validation.
- **Word Count:** (Medium) This exercise involves string parsing and counting, a common data processing task.
- **Anagram:** (Medium) This problem requires string manipulation and comparison, potentially using efficient algorithms.
- **Series:** (Medium) This exercise involves generating sequences, which can be relevant to time series data processing.
- **Luhn:** (Medium) This problem involves applying a specific algorithm to validate data, which is relevant to data quality.
- **Run-Length Encoding:** (Medium) This exercise deals with data compression, which can be relevant to data storage and efficiency.
- **Matrix:** (Medium) This problem involves processing data in a matrix format.
- **Pig Latin:** (Medium) This exercise focuses on string manipulation and word processing.

Hard:

- **Alphametics:** (Hard) This is a more complex logic puzzle that tests problem-solving skills.
- **Variable Length Quantity:** (Hard) This exercise involves encoding and decoding data, which is relevant to data serialization.

Ensure to publish your solutions for it to become visible in your public profile.
